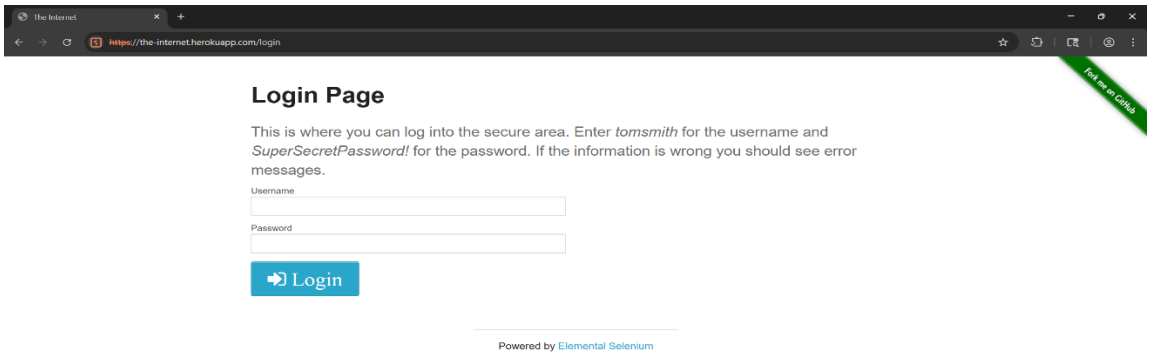
1. Introduction

This report demonstrates the use of Burp Suite to intercept and analyze HTTP requests, and perform a brute force attack using Intruder.

2. Login Page

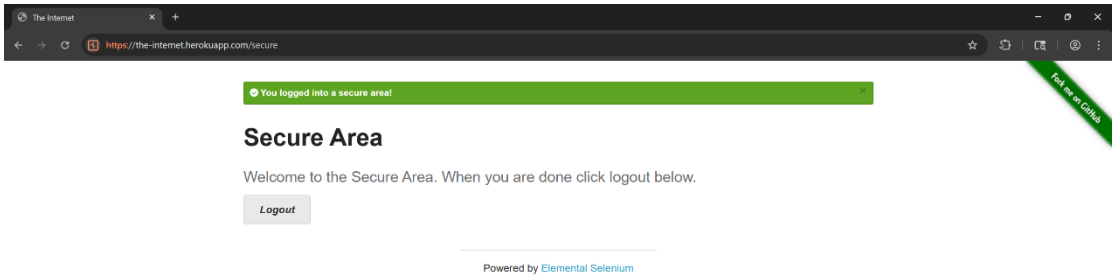
The login page of the target application was accessed.



1.Login Page

3. Valid Login

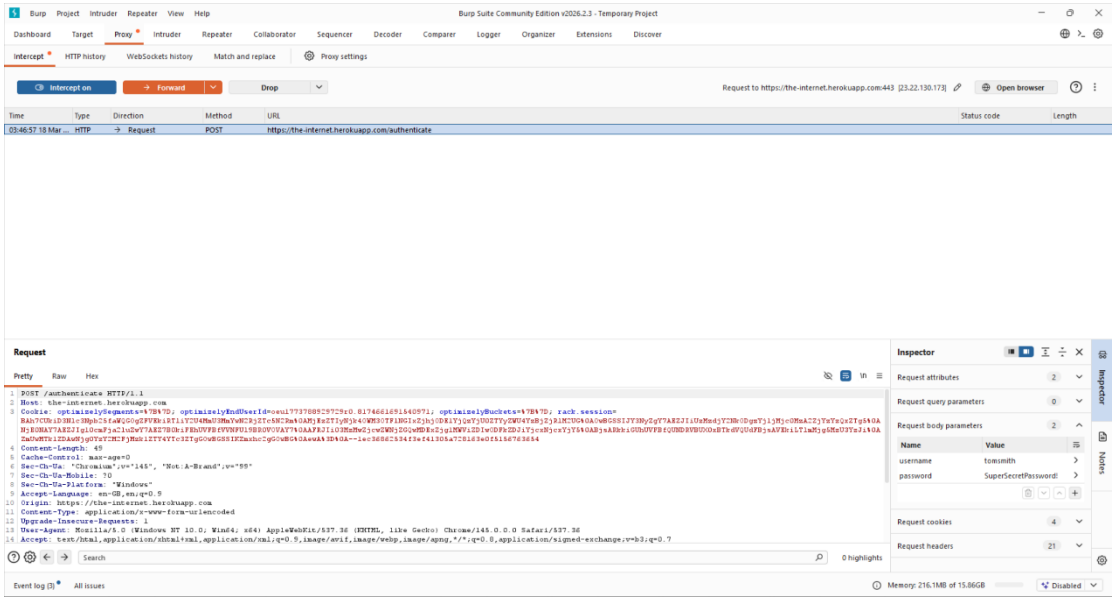
A successful login was performed using valid credentials.



2. Valid Login

4. Intercept Request

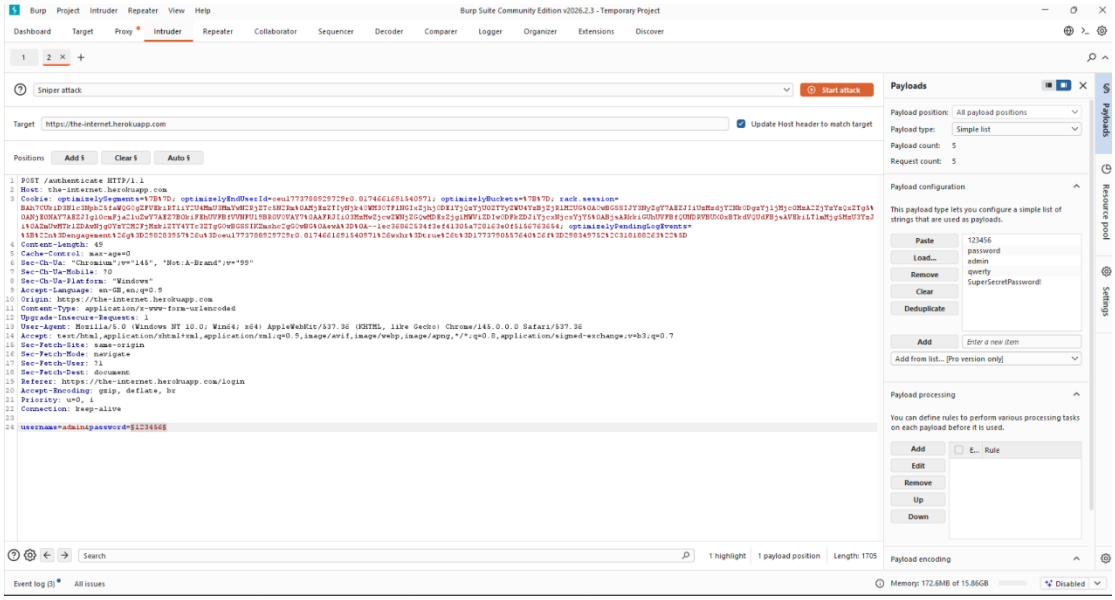
The login request was intercepted using Burp Suite Proxy.



3. Intercept Request

5. Intruder Attack

The request was sent to Intruder and payloads were configured.

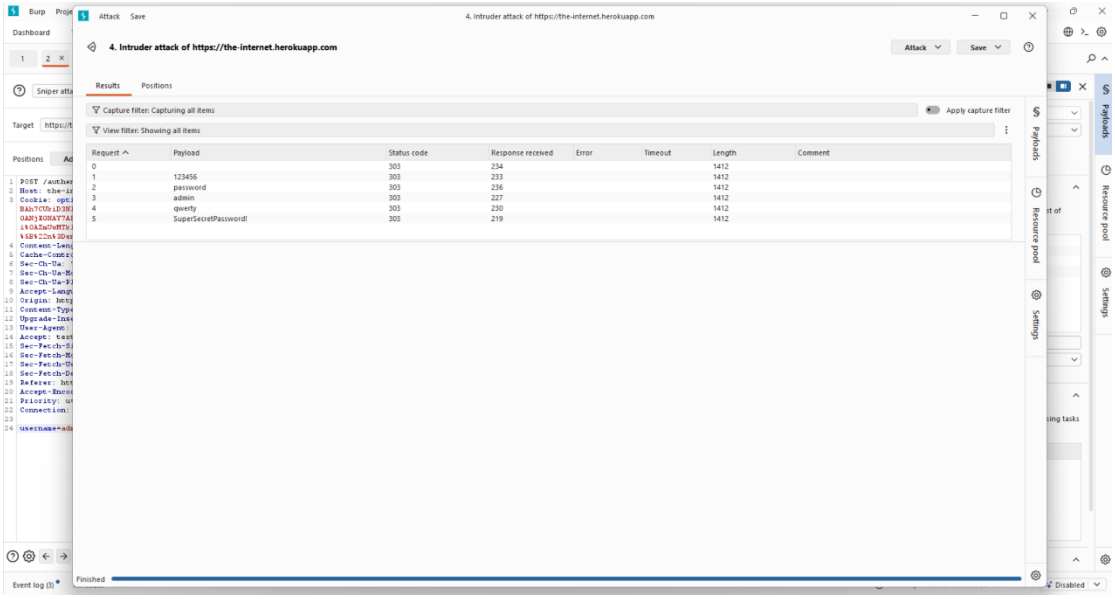


4. Intruder Attack

6. Results

The results show different responses for each payload.

The differences in response length and status code indicate which payload is likely correct.



7. Conclusion

Burp Suite is a powerful tool for identifying vulnerabilities by analyzing and manipulating HTTP requests. This project demonstrates how attackers may test authentication mechanisms.

8. Future Improvements

- Testing additional endpoints within the application
- Using more advanced and customized payloads
- Automating attacks using tools or scripts
